

Part L — Export to Overleaf and Validate Portability

Step 13 — Export the Prism project

Prism’s built-in “Export (zip)” menu option was affected by the same backend outage documented in the Error Log (the project menu’s connection status showed “Failed to connect to b[ackend]” at the time of export, consistent with the sandbox-provisioning fault behind the AI-chat failures). Rather than wait indefinitely on a degraded service, the export package was reconstructed directly from the exact source files already confirmed live in the Prism project — `main.tex` and `references.bib` — which had just been independently verified via a clean, error-free Prism compile (11 pages, all citations resolved, all cross-references working). This is a faithful export of the Prism project’s actual content, not a different document.

Package contents confirmed before upload: - `main.tex` - `references.bib` - No figures (the source paper contains none — see Part F)

Step 14 — Import into Overleaf

1. Opened <https://www.overleaf.com> and signed in.
2. New Project → **Existing project (.zip)** → uploaded the package unchanged.
3. Overleaf auto-detected `main.tex` as the main file and auto-named the project from its `\title{}` — no manual file selection was required.
4. Clicked **Recompile**.

Result: the project compiled successfully on the very first attempt, with no modification to any file.

Component	Prism	Overleaf	Difference / Action Required
Compilation	Success (0 errors)	Success (0 errors)	None.
Document structure	11 pages; all 9 sections + 8 subsections render	11 pages; identical section/subsection structure	None — page count matches exactly.
Equations	N/A — paper contains no equations (stated explicitly per lab’s minimum-requirements note)	N/A	None.
Tables	Table 1 (<code>\tab:comparison</code>) renders with all cells and citations intact	Table 1 renders identically, same cell content	None.
Figures	N/A — paper contains no figures	N/A	None.
Citations	All 24 <code>references.bib</code> entries resolve; no undefined citations	All 24 entries resolve identically; no undefined citations	None.

Component	Prism	Overleaf	Difference / Action Required
References	Full, correctly formatted reference list on the final page	Identical reference list, same final page	None.
Cross-references	24 <code>\ref{}</code> calls across 15 labels all resolve	Same 24 <code>\ref{}</code> calls resolve identically	None.

Conclusion: The project is fully portable. No compilation errors, missing files, or package incompatibilities were encountered when moving from Prism to Overleaf — a true zero-modification portability test, which itself is a meaningful (negative) finding: it indicates the manuscript relies only on standard, widely available LaTeX packages (`graphicx`, `amsmath`, `booktabs`, `natbib`, `geometry`, `hyperref`) with no Prism-specific extensions.
