

Part N — Final Verification Against the Original Paper

Item	Status
Title, authors, affiliations, abstract, and keywords match the original paper.	Verified — exact wording preserved (no affiliation was listed in the original paper, so none was added).
All major sections of the original paper are present.	All 9 sections and 8 subsections present, matching the source literature review’s structure.
All numerical results and dataset statistics are unchanged.	All percentages, case counts, study counts, and year ranges (e.g., 93%, 23–99%, 638 cases, 24 papers, 59 studies) verified against the source text — none altered.
All equations are mathematically equivalent to the original.	N/A — the source paper contains no equations or mathematical notation; stated explicitly (see Part D).
All tables contain the correct values, units, labels, and captions.	Table 1 checked cell-by-cell against the source; caption and <code>\label{tab:comparison}</code> added.
All figures are present and correctly referenced.	N/A — the source paper contains no figures; stated explicitly (see Part F).
All citations resolve and no reference has been fabricated.	All 24 <code>references.bib</code> entries compiled from the source paper’s own reference list; no DOI, volume, or page numbers were invented for entries where the source didn’t supply them (per the lab’s “Important Rule”).
All section, equation, table, and figure cross-references work.	24 <code>\ref{}</code> calls across 15 labels (14 section/subsection labels + 1 table label) all resolve correctly in both Prism and Overleaf; no equation/figure references (none exist in the source).
The Prism project compiles without errors.	Confirmed — “Compiled” status, 11 pages, 0 errors, 0 undefined citations.
The exported project has been tested in Overleaf.	Confirmed — zero-modification import, compiled successfully on first attempt, identical 11-page output (see Part L).

All 10 checklist items verified.
